II. AMENDMENTS TO THE CLAIMS

The following is a listing of claims to replace all prior versions and listings of claims in the application:

1. (Currently Amended) A computer-implemented method for reviewing a message ~~delivered to an end user during execution of a computer program code~~, the method comprising:

providing the message, wherein the message is crafted in a natural language by a developer in association with development of a computer program code and delivered by the computer program code to an end user in response to an event during execution of the computer program code;

configuring a review standard for reviewing linguistic aspects of the natural language used in crafting the message, wherein the review standard includes review parameters selected from a group consisting of: character limits, line limits, spell checks, grammar checks and a combination thereof;

reviewing the message, during development of the computer program code, based on the review standard to detect errors;

displaying any errors that are detected concurrently with the message; and

revising the message to address the errors.

2. (Previously Presented) The method of claim 1, wherein the providing comprises creating a new message.

3. (Previously Presented) The method of claim 2, wherein the creating comprises:

inputting text for the new message using a message creation interface;

designating whether the new message is an error message, a warning message, or an information message;

inputting an explanation and a suggested user action using the message creation interface if the new message is an error message or a warning message;

assigning a unique identifier to the new message; and

sending a notification pertaining to the new message.

4. (Original) The method of claim 3, further comprising displaying the computer program code associated with the new message concurrently with the text for the new message.

5. (Previously Presented) The method of claim 1, wherein the providing comprises editing an existing message.

6. (Previously Presented) The method of claim 5, wherein the editing comprises:

inputting a unique identifier corresponding to the existing message;

obtaining the existing message based on the unique identifier;

displaying the existing message in a message edit interface;

editing the existing message in the message edit interface; and

sending a notification pertaining to the edited existing message.

7. (Original) The method of claim 6, further comprising displaying the computer program code associated with the existing message concurrently with the existing message.

8. (Previously Presented) The method of claim 1, wherein the review parameters for ascertaining a structure of a message are retrieved from a saved resource.

9. (Previously Presented) The method of claim 1, wherein the review parameters are manually designated.

10. (Original) The method of claim 1, wherein the message and the errors are displayed concurrently with the computer program code associated with the message.

11. (Currently Amended) A computerized system for reviewing a message delivered to an end user ~~during execution of a computer program code~~, the system, comprising:

a message configuration system for configuring the message, wherein the message is crafted in a natural language by a developer in association with development of a computer program code and delivered by the computer program code to an end user in response to an event during execution of the computer program code;

a standard configuration system for configuring a review standard for reviewing linguistic aspects of the natural language used in crafting the message, wherein the review standard includes review parameters selected from a group consisting of: character limits, line limits, spell checks, grammar checks and a combination thereof; and

a message analysis system for reviewing the message, during development of the computer program code, based on the review standard to detect any errors, and for displaying the errors if detected.

12. (Original) The system of claim 11, wherein the message is a new message, and wherein the message configuration system comprises a message creation system for creating the new message.

13. (Original) The system of claim 12, wherein the message creation system comprises:

a creation interface system for providing a message creation interface for inputting text for the new message and an explanation and a suggested user action if the new message is an error message or a warning message; and

an identifier assignment system for assigning a unique identifier to the new message, and for saving the new message according to the unique identifier.

14. (Original) The system of claim 13, wherein the message creation interface further displays the computer program code associated with the new message concurrently with the new message.

15. (Original) The system of claim 11, wherein the message is an existing message, and wherein the message configuration system comprises a message edit system.

16. (Original) The system of claim 15, wherein the message edit system comprises:

a message retrieval for receiving a unique identifier corresponding to the existing message, and for obtaining the existing message based on the unique identifier;

an edit interface system for providing a message edit interface for editing the existing message once obtained; and

an edit recording system for saving the edited existing message according to the unique identifier.

17. (Original) The system of claim 16, wherein the message edit interface further displays the computer program code associated with the existing message concurrently with the existing message.

18. (Original) The system of claim 11, wherein the message configuration system comprises a message deletion system that comprises:

a message retrieval system for receiving a unique identifier corresponding to a particular message, and for obtaining the particular message based on the unique identifier; and

a deletion interface system for providing a message deletion interface for deleting the particular message once obtained .

19. (Previously Presented) The system of claim 11, wherein the review parameters for ascertaining a structure of a message are retrieved from a saved resource.

20. (Previously Presented) The system of claim 11, wherein the review parameters are manually designated.

21. (Original) The system of claim 11, wherein the message and the errors are displayed concurrently.

22. (Currently Amended) A program product stored on a recordable medium for reviewing a message ~~delivered to an end user during execution of a computer program code, the method, which when executed~~, comprises:

program code for configuring the message, wherein the message is crafted in a natural language by a developer in association with development of a computer program code and delivered by the computer program code to an end user in response to an event during execution of the computer program code;

program code for configuring a review standard for reviewing linguistic aspects of the natural language used in crafting the message, wherein the review standard includes review parameters selected from a group consisting of: character limits, line limits, spell checks, grammar checks and a combination thereof; and

program code for reviewing the message, during development of the computer program code, based on the review standard to detect any errors, and for displaying the errors if detected.

23. (Original) The program product of claim 22, wherein the message is a new message, and wherein the program code for configuring the message comprises program code for creating the new message.

24. (Original) The program product of claim 23, wherein the program code for creating the new message comprises:

program code for providing a message creation interface for inputting text for the new message and an explanation and a suggested user action if the new message is an error message or a warning message; and

program code for assigning a unique identifier to the new message, and for saving the new message according to the unique identifier.

25. (Original) The program product of claim 24, wherein the message creation interface further displays the computer program code associated with the new message concurrently with the new message.

26. (Original) The program product of claim 22, wherein the message is an existing message, and wherein the program code for configuring the message comprises program code for editing the existing message.

27. (Original) The program product of claim 26, wherein the program code for editing the existing message comprises:

program code for receiving a unique identifier corresponding to the existing message, and for obtaining the existing message based on the unique identifier; and

program code for providing a message edit interface for editing the existing message once obtained; and

program code for saving the edited existing message according to the unique identifier.

28. (Original) The program product of claim 27, wherein the message edit interface further displays the computer program code associated with the existing message concurrently with the existing message.

29. (Original) The program product of claim 22, wherein the program code for configuring the message comprises program code for deleting an existing message that comprises:

program code for receiving a unique identifier corresponding to an existing message, and for obtaining the existing message based on the unique identifier; and

program code for providing a message deletion interface for deleting the existing message once obtained.

30. (Previously Presented) The program product of claim 22, wherein the review parameters for ascertaining a structure of a message are retrieved from a saved resource.

31. (Previously Presented) The program product of claim 22, wherein the review parameters are manually designated.

32. (Original) The program product of claim 22, wherein the message and the errors are displayed concurrently.
